

In the Claims:

Please amend claims 1, 7-8, and 10-11 as follows:

1-6. (Cancelled)

7. (Currently Amended) A liquid crystal display device comprising:

a first substrate;

a plurality of groups of stepwise structures formed on the first substrate,
wherein the structures of each group extend in parallel in a partial region of the first substrate when
viewed in a direction perpendicular to the first substrate and have~~to have~~ a stepwise cross section;

a resist film which is formed on ~~the~~each stepwise structure, and on a surface of which
a wrinkle-like roughness extending in a substantially same direction as ~~the~~each stepwise structure is
provided;

a reflective electrode formed on the resist film and having ~~a~~a roughness that follows
the surface of the resist film;

a second substrate arranged to oppose to the first substrate; and

a liquid crystal sealed between the first substrate and the second substrate.

8. (Currently Amended) A liquid crystal display device according to claim 7,

wherein a cross section of ~~the~~each stepwise structure, which is perpendicular to a longitudinal
direction, is asymmetrical.

9. (Original) A liquid crystal display device according to claim 7, wherein an existence probability of an azimuth of the roughness on a surface of the reflective electrode is maximum in a horizontal direction.

10. (Currently Amended) A liquid crystal display device according to claim 7, wherein ~~the~~each stepwise structure is formed by a photoresist.

11. (Currently Amended) A liquid crystal display device according to claim 7, wherein at least a part of ~~the~~each stepwise structure is formed by the same material as a wiring that supplies a signal to the reflective electrode.

12. (Original) A liquid crystal display device according to claim 7, wherein an opening portion for passing a light through is provided in the reflective electrode.

13-16. (Cancelled)
